

Final Assignment

Lapo Corrado D'Auria s3340775

Ana Maria Enea s3384918

For our final project, we decided to create an interactive minigame in which you control a car. The aim of the game is to avoid obstacles. To help you navigate these obstacles, we created a program with four main components. We used a force component to simulate the car's suspension and flocking in fact, we implemented a flocking-based algorithm to simulate bird flight and random functions to create realistic, dynamic cloud effects and stars. We used a particle system to simulate the car's functionality. For interactions, the keyboard and mouse were the main means. Pressing the S or W keys on the keyboard moves the car. Clicking the mouse on the car changes the scene in the programme and applies a force to the suspension. Another interesting interaction occurs when the car comes into contact with an obstacle, which gives the car a force.

Below you can see how the code is structured:

Disclaimer on AI

Throughout this assignment, we used AI to evaluate our project and only for debugging purposes if we got stuck for too long.

The only times we used AI-generated code and referenced it in our code.
